PROFESSIONAL PROFILE

Backend Developer specialized in asynchronous systems with Python and Go. Running end-to-end production infrastructure (DNS, CDN, S3-compatible storage, reverse proxy), moving toward Infrastructure-as-Code. Built SmartExpense, an expense management system with smart categorization on a webhook/worker architecture. Focused on distributed backend systems, API design, and cloud infrastructure.

EXPERIENCE

Freelance Backend Developer

Bricka Real State Agency

Remote, Argentina

2025 - Present

- Sole engineer behind a custom CRM for Bricka — planning, building, and maintaining a multi-module Django system covering property listings with geospatial data (PostGIS) and status management, rental administration, contact management, and receipt generation.
- Asynchronous scheduled task processing (rent payment tracking, increase dates, contract expirations, notifications) with Celery and Celery Beat. Document and media storage on R2 behind Cloudflare's CDN.
- Two-way integration layer with external platforms — property publishing and asynchronous lead ingestion via webhooks (ZonaProp, ArgenProp) — extensible through independent handlers.

Freelance Backend Consultant

Radio Facundo Quiroga

Chaco, Argentina

2024-2025

- Diagnosed and resolved N+1 query patterns in a Django system serving employee metrics — duplicated queries across ORM relationships were driving response times over 1 second; added targeted indexes on high-frequency columns.

Club Coordinator

Deer Crest Club - St. Regis at Deer Valley

Park City - Utah, United States

2021-2024

- Promoted from Ski Valet to Club Coordinator across the club's four areas at a private luxury ski club. Operated entirely in English, coordinating multicultural teams in a high-demand environment.

SKILLS

Languages & Frameworks: Python, Django, FastAPI, Go, net/http, SQL

Data & Async: PostgreSQL, Redis, Celery, ARQ, asyncio, pytest

DevOps: Docker, Git, GitHub Actions (CI/CD), Linux, Nginx, AWS (EC2 & S3), Cloudflare (DNS & R2)

PROJECTS

SmartExpense - [link to repo](#)

2025

Message-based expense management system with a decoupled async architecture.

- Rewrote the receiver as a Go microservice (net/http) — idempotent message handling via Redis SETNX with TTL, graceful shutdown, and dependency injection for mock-based testing. [link to repo](#)
- The receiver returns HTTP 200 to messaging services immediately while ARQ workers handle categorization and persistence asynchronously, eliminating timeout failures under load.
- 151 tests validating API contracts, integration, and bot behavior — 100% coverage as a byproduct, full run in under 21 seconds.

EDUCATION

Institute Santo Domingo, Argentina

Computer System Analyst

2023-2026
